Abstract

This paper studies the Brusselator model of a class of nonlinear reaction-diffusion equations, so it is very important to find a simple and effective numerical method for nonlinear reaction-diffusion systems. Based on this problem, some numerical examples are simulated by using this new spatial spectral interpolation collocation method.

1. 引言

Brusselator 模型是一个著名的模型[1][2], 它通常是用来描述化学反应过程中化学元素变化的一类反应扩散方程组[3]。其形式为:

$$\begin{cases} \frac{\partial u}{\partial t} = \Delta(u_{11}u + u_{12}v) - (\beta + 1)u + u^2v + \alpha, & (x, t) \in \Omega \times [0, T] \\ \frac{\partial v}{\partial t} = \Delta(u_{21}u + u_{22}v) + \beta u - u^2v, & (x, t) \in \Omega \times [0, T] \\ \frac{\partial u}{\partial n} = \frac{\partial v}{\partial n} = 0, & (x, t) \in \partial\Omega \times [0, T] \\ u(x, 0) = \psi_1(x), v(x, 0) = \psi_2(x), & x \in \Omega \end{cases} \quad (1)$$

其中: $u(x, y, t)$ 和 $v(x, y, t)$ 是未知函数, $u_{11}, u_{12}, u_{21}, u_{22}$ 是扩散系数, $\Delta = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}$ 是拉普拉斯算子, $(x, y) \in \Omega, t > 0$ 在光滑的边界 $\partial\Omega$ 上的齐次 Neumann 边界条件, 即 $\partial u / \partial n|_{\partial\Omega} = \partial v / \partial n|_{\partial\Omega}$, $f(u, v), g(u, v)$ 是已知的光滑函数。

许多方法被用来解决 Brusselator 模型。这些方法包括有限差分法[4], Galerkin 有限元法[5], 最佳均匀(BURA)有理近似[6]。本文基于一种新的空间谱插值配点方法, 研究了 Brusselator 系统的动力学行为, 分析了该系统的稳定性[7][8]。数值模拟结果和理论吻合较好, 仿真结果表明了该方法的有效性。

2. 空间谱插值配点方法的描述

在本文中, 我们使用空间谱插值配点方法来解决 Brusselator 模型(1)。

从参考文献[9][10]中, 我们可以得到离散序列 u_1, u_2, \dots, u_N 的插值函数 $I_N u(x)$ 可以写成:

$$u(x) \sim I_N u(x) = \sum_{m=1}^N u_m S_N(x - x_m) \quad (2)$$

其中 $S_N(x) = \frac{\sin(\pi x/h)}{(2\pi/h)\tan(x/2)}$, I_N 对于任何函数, 都是这样的插值算子, $u(x)$ 在区间 $[0, 2\pi]$ 定义为 $u_j = u(jh), j = 1, \dots, N, x_j - x_m = (j - m)h$, 插值空间为 $\text{span}\{S_N(x - jh), j = 1, 2, \dots, N\}$ 。由此推导出 n 阶导数的简单表达式并不难 $I_N u(x)$ 在 $x_j = jh$ 处的 n 阶导数的简单表达式并不难, 为:

$$I_N u^{(n)}(x_j) = \sum_{m=1}^N u_m S_N^{(n)}(x_j - x_m) \quad (3)$$

其中 $D_N^{(n)} = [S_N^{(n)}(x_j - x_m)]_{i,j=1,2,\dots,N}$ 被称为第 n 个谱微分矩阵[9]。

这里我们考虑有限空间域 $\Omega = [0, 2\pi] \times [0, 2\pi]$ 。我们定义 N^2 个等间距的网格点在区域 Ω 上，因此

$$(x_i, y_j) = (ih, jh), i, j = 1, 2, 3, \dots, N.$$

其中 $h = \frac{2\pi}{N}$ 对于给定的有限自然数 $N \in \mathbb{N}$ 。使用(2)则配点函数 $I_N u(x, y, t)$ 和 $I_N v(x, y, t)$ 关于函数 $u(x, y, t)$ 和 $v(x, y, t)$ 可以被写为：

$$\begin{aligned} u(x, y, t) &\sim I_N u(x, y, t) = \sum_{i=1}^N \sum_{j=1}^N S_N(x - x_i) S_N(y - y_j) u(x_i, y_j, t) \\ v(x, y, t) &\sim I_N v(x, y, t) = \sum_{i=1}^N \sum_{j=1}^N S_N(x - x_i) S_N(y - y_j) v(x_i, y_j, t) \end{aligned} \quad (4)$$

其中 $u_{i,j} = u(x_i, y_j, t), v_{i,j} = v(x_i, y_j, t), i, j = 1, 2, \dots, N$ 。因此，下列关系在搭配点 (x_p, y_q) 处成立：

$$\begin{aligned} u(x_p, y_q, t) &\sim I_N u(x_p, y_q, t) = \sum_{i=1}^N \sum_{j=1}^N S_N(x_p - x_i) S_N(y_q - y_j) u(x_i, y_j, t) \\ v(x_p, y_q, t) &\sim I_N v(x_p, y_q, t) = \sum_{i=1}^N \sum_{j=1}^N S_N(x_p - x_i) S_N(y_q - y_j) v(x_i, y_j, t) \\ u^{(2,0)}(x_p, y_q, t) &\sim I_N u^{(2,0)}(x_p, y_q, t) = \frac{\partial^2 u(x_p, y_q, t)}{\partial x^2} = \sum_{i=1}^N \sum_{j=1}^N S_N^{(2)}(x_p - x_i) S_N(y_q - y_j) u(x_i, y_j, t) \\ u^{(0,2)}(x_p, y_q, t) &\sim I_N u^{(0,2)}(x_p, y_q, t) = \frac{\partial^2 u(x_p, y_q, t)}{\partial y^2} = \sum_{i=1}^N \sum_{j=1}^N S_N(x_p - x_i) S_N^{(2)}(y_q - y_j) u(x_i, y_j, t) \\ v^{(2,0)}(x_p, y_q, t) &\sim I_N v^{(2,0)}(x_p, y_q, t) = \frac{\partial^2 v(x_p, y_q, t)}{\partial x^2} = \sum_{i=1}^N \sum_{j=1}^N S_N^{(2)}(x_p - x_i) S_N(y_q - y_j) v(x_i, y_j, t) \\ v^{(0,2)}(x_p, y_q, t) &\sim I_N v^{(0,2)}(x_p, y_q, t) = \frac{\partial^2 v(x_p, y_q, t)}{\partial y^2} = \sum_{i=1}^N \sum_{j=1}^N S_N(x_p - x_i) S_N^{(2)}(y_q - y_j) v(x_i, y_j, t) \end{aligned} \quad (5)$$

注意的是

$$\begin{aligned} u &= [u_{11}, u_{21}, \dots, u_{N1}, u_{12}, u_{22}, \dots, u_{N2}, u_{1N}, \dots, u_{NN}]^T, \\ v &= [v_{11}, v_{21}, \dots, v_{N1}, v_{12}, v_{22}, \dots, v_{N2}, v_{1N}, \dots, v_{NN}]^T, \end{aligned} \quad (6)$$

因此，公式(5)可以被写成一下矩阵形式：

$$\begin{aligned} u^{(2,0)} &= D_N^{(2,0)} u, u^{(0,2)} = D_N^{(0,2)} u, v^{(2,0)} \\ &= D_N^{(2,0)} v, v^{(0,2)} = D_N^{(0,2)} v. \\ D_N^{(2,0)} u &= D_N^{(2)} \otimes E_N, D_N^{(0,2)} \\ &= E_N \otimes D_N^{(2)}, D_N^{(0,0)} = E_N \otimes E_N, \end{aligned} \quad (7)$$

其中 E_N 是 N 阶单位矩阵， \otimes 是矩阵的克罗内克积，相反地。二阶谱微分矩阵为：

$$D_N^{(2)} = \begin{pmatrix} -\frac{\pi^2}{3h^2} - \frac{1}{6} & \ddots & & \vdots & \ddots & \frac{1}{2} \csc^2\left(\frac{1h}{2}\right) \\ \vdots & \ddots & & \vdots & \ddots & \frac{1}{2} \csc^2\left(\frac{1h}{2}\right) \\ \frac{1}{2} \csc^2\left(\frac{1h}{2}\right) & \ddots & -\frac{1}{2} \csc^2\left(\frac{2h}{2}\right) & \ddots & \frac{1}{2} \csc^2\left(\frac{2h}{2}\right) \\ \vdots & \ddots & \frac{1}{2} \csc^2\left(\frac{2h}{2}\right) & \ddots & \frac{1}{2} \csc^2\left(\frac{3h}{2}\right) & \vdots \\ \frac{1}{2} \csc^2\left(\frac{3h}{2}\right) & \ddots & \frac{1}{2} \csc^2\left(\frac{1h}{2}\right) & \ddots & \frac{1}{2} \csc^2\left(\frac{2h}{2}\right) & \vdots \\ \frac{1}{2} \csc^2\left(\frac{2h}{2}\right) & \ddots & \frac{1}{2} \csc^2\left(\frac{1h}{2}\right) & \ddots & \frac{1}{2} \csc^2\left(\frac{1h}{2}\right) & \vdots \\ \frac{1}{2} \csc^2\left(\frac{1h}{2}\right) & \ddots & \vdots & \ddots & -\frac{\pi^2}{3h^2} - \frac{1}{6} & \vdots \end{pmatrix} \quad (8)$$

结合等式(6)和等式(7), Equation (1)可以写成以下系统:

$$\frac{\partial}{\partial t} \begin{bmatrix} u \\ v \end{bmatrix} = \begin{bmatrix} u_{11}D & u_{12}D \\ u_{21}D & u_{22}D \end{bmatrix} \begin{bmatrix} u \\ v \end{bmatrix} = \begin{bmatrix} f_1(u, v) \\ f_2(u, v) \end{bmatrix} \quad (9)$$

这里

$$[u, v] = [u_{11}, \dots, u_{N1}, u_{12}, \dots, u_{N2}, u_{1N}, \dots, u_{NN}, v_{11}, \dots, v_{N1}, v_{12}, \dots, v_{N2}, v_{1N}, \dots, v_{NN}],$$

$$\begin{aligned} D &= D_N^{(2,0)} + D_N^{(0,2)} \\ &= D_N^{(2)} \otimes E_N + E_N \otimes D_N^{(2)}, \end{aligned}$$

$$\begin{aligned} &[f_1(u, v), f_2(u, v)] \\ &= [f_1(u_{11}, v_{11}), \dots, f_1(u_{NN}, v_{NN}), f_2(u_{11}, v_{11}), \dots, f_2(u_{NN}, v_{NN}), f_3(u_{11}, v_{11}), \dots, f_3(u_{NN}, v_{NN})] \end{aligned}$$

利用 Matlab 中的 ode45 求解器求解系统(9), 得到系统(1)的数值解。

3. 动力系统分析

在这一部分, 我们给出了 Brusselator 模型的图灵分叉分析[11]。如果不考虑扩散现象, 即假设扩散系数为零时, 则方程(1)就可以写为:

$$\begin{cases} \frac{du}{dt} = \alpha + u^2v - (\beta + 1)u \\ \frac{dv}{dt} = \beta u - u^2v \end{cases} \quad (10)$$

从动力学角度我们来分析系统(10)的解的性质[12]。首先(10)只有唯一的平衡解 $(\alpha, \beta/\alpha)$ 。其次, 讨论这一平衡解的稳定性。为此考虑(10)的 Jacobian 矩阵:

$$DF(u, v) = \begin{bmatrix} 2uv - (\beta + 1) & u^2 \\ \beta - 2uv & -u^2 \end{bmatrix},$$

其在平衡解 $(\alpha, \beta/\alpha)$ 的 Jacobian 矩阵为:

$$DF(\alpha, \beta/\alpha) = \begin{bmatrix} \beta - 1 & \alpha^2 \\ -\beta & -\alpha^2 \end{bmatrix} \quad (11)$$

显见矩阵(11)的迹 $\tau = \text{trac}DF(\alpha, \beta/\alpha) = -\alpha^2 + \beta - 1$, 判别式 $\Delta = -\alpha^2(\beta - 1) + \alpha^2\beta = \alpha^2$ 。由于 $\Delta = \alpha^2 > 0$, 所以(11)的特征根同号, 故:

- 1) 若 $\tau < 0$, 即 $\beta > \alpha + 1$, 平衡解 $(\alpha, \beta/\alpha)$ 是稳定的;
- 2) 若 $\tau > 0$, 即 $\beta < \alpha + 1$, 平衡解 $(\alpha, \beta/\alpha)$ 是发散的。

下面讨论(10)的分岔。固定 α , 让 β 变动。由 $\tau = 0$ 得到 $\beta_H = \alpha^2 + 1$ 。下面我们来证明 β_H 是(10)的 Hopf 分岔点[13] [14] [15], 设 λ 为(11)的特征根, 为此必须证明: (a) (11)在 β_H 点只有一对纯虚根。(b) $\partial \text{Re}(\lambda)/\partial \beta \neq 0$ 。事实上, (11)的特征根为 $\lambda_{1,2} = (\tau \pm \sqrt{\tau^2 - 4\Delta})/2$, 由 $\tau = 0$ 及 $\Delta = \alpha^2$ 知 $\lambda_{1,2} = \pm \alpha i$ 。所以(a)成立。其次, 由 $\lambda_{1,2} = (\tau \pm \sqrt{\tau^2 - 4\Delta})/2$ 可得 $\text{Re}(\lambda) = (-\alpha^2 + \beta - 1)/2$, 所以 $\partial \text{Re}(\lambda)/\partial \beta = 1/2 \neq 0$, 故(b)也成立。综上所述, β_H 为系统(10)的 Hopf 分岔点, 且由于 $\tau < 0$ 时系统的平衡不稳定, 所以由 $\tau < 0$ 变化到 $\tau = 0$ 系统在 Hopf 分岔点处得到稳定性[14]。

4. 数值实验

在这一节中, 我们给出了一些数值例子, 以便更好地解释使用不同的初始条件和参数的上述分析结果。

例 1 考虑以下形式的 Brusselator 模型[3]:

$$\begin{cases} \frac{\partial u}{\partial t} = \Delta u_1 u - (\beta + 1)u + u^2 v + \alpha, & (x, t) \in \Omega \times [0, T] \\ \frac{\partial v}{\partial t} = \Delta u_2 v + \beta u - u^2 v, & (x, t) \in \Omega \times [0, T] \\ \frac{\partial u}{\partial n} = \frac{\partial v}{\partial n} = 0, & (x, t) \in \partial \Omega \times [0, T] \\ u(x, 0) = \psi_1(x), v(x, 0) = \psi_2(x), & x \in \Omega \end{cases} \quad (12)$$

这里 $\alpha, \beta > 0$, u_1, u_2 为常数, $t \in R_+$ 为时间变量, $x, y \in R$ 是空间变量, u, v 是 t 与 x, y 的函数。其中 $u_1 = 0.0025, u_2 = 0.0032, \alpha = 2, \beta = 1, v = \text{ones}(N)$, 固定一个初始条件, 当 u 变化时模拟的结果见图 1~10, 具体初始条件见表 1。

例 2: 考虑以下形式的 Brusselator 模型[3]:

$$\begin{cases} \frac{\partial u}{\partial t} = \Delta(u_{11}u + u_{12}v) - (\beta + 1)u + u^2 v + \alpha, & (x, t) \in \Omega \times [0, T] \\ \frac{\partial v}{\partial t} = \Delta(u_{21}u + u_{22}v) + \beta u - u^2 v, & (x, t) \in \Omega \times [0, T] \\ \frac{\partial u}{\partial n} = \frac{\partial v}{\partial n} = 0, & (x, t) \in \partial \Omega \times [0, T] \\ u(x, 0) = \psi_1(x), v(x, 0) = \psi_2(x), & x \in \Omega \end{cases} \quad (13)$$

这里 $\alpha, \beta > 0$, $u_{11}, u_{12}, u_{21}, u_{22}$ 为常数, $t \in R_+$ 为时间变量, $x, y \in R$ 是空间变量, u, v 是 t 与 x, y 的函数。其中 $u_{11} = 0.4, u_{12} = 22.2665, u_{21} = 0.02, u_{22} = 2, \alpha = 6, \beta = 1$; 本文方法得到的数值结果见图 11~22, 具体的初始条件见表 2。

图 15 和图 16	$u = \operatorname{sech}(\pi(-x^2 + y^2))$
图 17 和图 18	$u = \sin(\pi(-x^2 - y^2))$
图 19 和图 20	$u = 12/25 - \sin(10x^2 - 510) + \sin(\pi y - 220)$
图 21 和图 22	$u = 12/25 - \sin(\pi x^2 - 510) + \sin(\cos(x^2 + y^2 - 22))$

5. 结论

本文用谱插值配点方法求解 Brusselator 模型，数值结果表明了该方法与理论吻合较好。本文所有程序由 matlab2017b 算得。

致 谢

感谢王玉兰老师的 support 与帮助。
